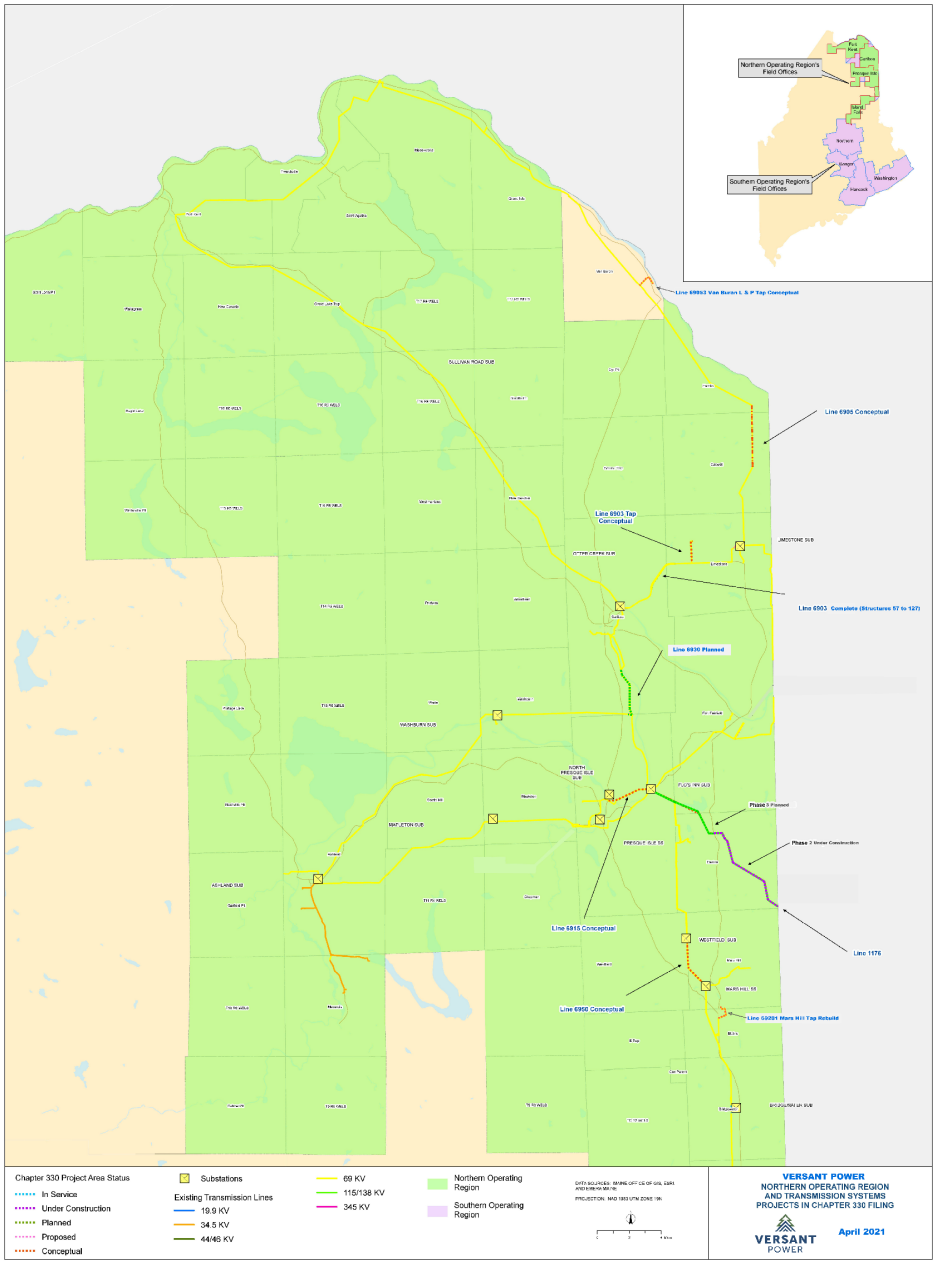
June 17, 2021

2021 Planning Advisory Group Meeting

Northern Maine Transmission System



VERSANT POWER

Transmission Planning Collaboration

- Adjusted based on customer feedback
- Intent: spread out remaining required MPD rebuild plan over 15-20 years (total rebuild program will span nearly 30 years)
- Final plan subject to enhanced inspection findings (drone, resistograph, climbing)
- Line and targeted line segment rebuilds will be necessary

VERSANT POWER

Chapter 330 Plans & Adjustments

VERSANT POWER

Enhanced Inspection Methods

Visual inspections performed by drone technology are providing engineers with a new and different view of asset condition

VERSANT POWER

Example of a Closeup Drone Inspection Photo

VERSANT POWER

Enhanced Inspection Methods continued…Wood Pole Strength Assessment using Resistograph

Using a long thin needle the electric power consumption of the resistograph drilling device is measured and recorded. The resistance data gathered provides a high linear correlation between the measured values and the density of the penetrated wood.

VERSANT POWER

MPD Solar Generation Interconnections

- Dist. (State) projects:
  - 36 Level 4 – 114.5 MW's total
  - 3 Level 2 – 0.5 MW's total
- Transmission (FERC) projects:
  - 2 – 25 MW's total
- Projects/circuits are studied to ensure system protection and reliability for adjacent customers is maintained

VERSANT POWER

MPD Transmission Studies

- Two Transmission studies initiated
  - Interface study by NBP
    - How will these generators impact interface connections?
  - Versant is conducting a Transmission study of the MPD system at the direction of, and in concert with, NMISA
    - Will these projects and the grid “play well together”?
- Both will be conducted at high generation, low load conditions

VERSANT POWER

Path to 100% Renewable

- Solar generation (nameplate): 122 MW
- Peak Load: approximately 95 MW
- This represents a solar generation to peak load of 128%: compare to…
  - California: 61%
  - Hawaii: 86%
- Voltage controls and Reactive power support (options are DVARs and Storage) will be necessary at both the circuit and transmission levels

VERSANT POWER

Complexity Will Increase

- DER's add system complexity – forecasting generation
- Power Quality controls (inverter based generation)
- Outage restoration methods with DER's
- Grid controls on a partly cloudy day

VERSANT POWER
